

TOP SECRET

25X1

Attachment to: [REDACTED]

GROUP I

1. This Mission explores for the first time a vital area of the UKRAINE which may reveal indications of missile activity associated with the Long Range Bomber Bases: POLTAVA, CHEPELEVKA, ZHITOMIR, MIRGOROD, and BELAYA TSERKOV. We look for construction activity nearby these bases which may be comparable to that uncovered in Mission [REDACTED] at BEREZOVKA, construction work thus far unidentified but strongly suspect in the community as being ICBM related. As a result of Mission [REDACTED] there is suspicion that at KAZAN, a new Long Range Supersonic Bomber may be in production. Coverage of the aforementioned airfields may also answer the question of whether this aircraft is sufficiently far along in production to be manifesting itself in the Long Range Air Army inventory.

2. The coverage of the rail line from KIEV to ODESSA is an area suspect for IRBM deployment.

3. DAZ, a target of Mission [REDACTED] was cloud-covered. It is agreed [REDACTED] that this plant at DNEPROPETROVSK is engaged in missile production. We have no information which would detail what kind of missiles are being produced. It is possible that photography of this installation could provide an indication of type and may reveal static test stands. Such photography might provide the key for identification of other missile production plants already photographed or photographed in the future. KIEV, a sizeable industrial complex is also suspect for missile production.

4. GURYEV/MAKAT, a known [REDACTED] instrumentation site for TYURA TAM and the Caspian Sea Special Test Range, as well as possibly for Long Range Missile testing from KAPUSTIN YAR, could provide indications on communication and radar capabilities sorely needed by our experts and consultants.
